ABSTRACT

A nonaqueous electrolyte which contains an ionic liquid having general formula (1) below and a melting point not higher than 50°C, a compound which reductively decomposes at a more noble potential than the ionic liquid, and a lithium salt.

$$\begin{bmatrix} R^{1} \\ R^{2} - X - R^{3} \\ R^{4} \end{bmatrix}^{+} \cdot Y \tag{1}$$

In formula (1), R^1 to R^4 are each independently an alkyl group of 1 to 5 carbons or an alkoxyalkyl group of the formula $R'-O-(CH_2)_n-(R')$ being methyl or ethyl, and the letter n being an integer from 1 to 4), and any two from among R^1 , R^2 , R^3 and R^4 may together form a ring, with the proviso that at least one of R^1 to R^4 is an alkoxyalkyl group of the above formula. X is a nitrogen atom or a phosphorus atom, and Y is a monovalent anion.
